Estate Counselors, LLC monitors a number of forward looking economic indicators in an effort to identify when the risks of a market bubble or adverse economic conditions are increasing. If those indicators suggest there is an unusually high risk that a market bubble has formed or that a recession is on the horizon, then we may recommend to our clients that they consider investing in option contracts that are intended to increase in value should either a bubble pop or a recession take hold.

The following is a list of indexes tracked by Estate Counselors, LLC and their current forecast. Based on the data below it appears that:

Economic Risk is **MODERATE**.

Market Risk is **ELEVATED**.

Hidden Markov Model (HMM) indicates that the equity markets are currently in a **BEAR MARKET** trend. (A more detailed discussion of HMM can be found later in this Report.)

Estate Counselors' Equity Hedge Index (ECHI) is signaling **HEDGE OFF**. (Please see below for a description of ECHI.)

Stocks have held their ground near all-time highs while volatility has remained subdued over the past month. As was the case last month, many stock market valuation indicators are suggesting that equities are overvalued. However, this appears to be the new normal given the low interest rate backdrop and we believe equity prices could remain elevated for some time.

Our VA4 strategy is currently directing a slight underweighting to stocks in our client portfolios. Meanwhile, our CAAR strategy has directed an increased allocation to minimum volatility equities and longer term bonds. Quarterly CAAR rebalancing trades will be made next week, but at this time the new allocations are unknown.

Because market risk is elevated, we continue to maintain a cautious outlook, although as of August 24th ECHI is signaling Hedge Off. As a result, we are not recommending the purchase of put options in our clients' accounts at the present time.

A. ECONOMIC INDICATORS

1. **Capital Spectator's U.S. Economic Trend Index (ETI).** ETI rebounded last month, and the current reading is above the danger zone that would indicate a high probability of a recession beginning.

ETI is a diffusion index that measures the percentage of 14 leading and coincident indicators that are trending positive for economic growth. More specifically, a diffusion index represents the percentage of the variables that are positive. Accordingly, if all of the indexes included in ETI were positive, the value of the ETI index would be 1.0 or 100%. If 7 of the 14 variables were positive, the value of the ETI index would be 0.50 or 50%. Higher readings equate with more indicators signaling that the economy is expanding; lower readings imply a weaker economy, with levels below 50% signaling a high probability that a recession has started. This index is typically released mid-month based on data for the prior month.

As of August 21st, the ETI index reading was **66.7%**. Higher readings equate with more indicators signaling that the economy is expanding; lower readings imply a weaker economy, with levels below 50% signaling a high probability that a recession has started.

One month ago: 59.5%
Two months ago: 61.9%

2. **Capital Spectator's U.S. Economic Momentum Index (EMI).** EMI ticked a tenth lower this month but continues to indicate recession risk is low.

EMI is the monthly median percentage change for the 14 indicators that comprise the ETI. EMI is based on the median rather than the average (i.e., the mean) of these indexes because the mean is subject to outlier numbers, which can mislead us as to the true average. The median, by contrast, is immune to extremes because it reflects the middle point for a batch of numbers. As is the case with the ETI, this index is typically released mid-month based on data for the prior month.

As of August 21st, the EMI index reading is **1.7%**. Near zero and below zero readings are indicative of recessions, usually with a slight lead time relative to the start dates, as determined by the National Bureau of Economic Research.

One month ago: 1.8%
Two months ago: 1.7%

3. **Capital Spectator's Macro-Markets Risk Index (MMRI).** The most recent MMRI signal suggests that business risk is low.

MMRI measures the daily median change of U.S. stock, bond, and oil prices. Because this information is available in real time, with continuous updates, prices have an edge over conventional economic statistics, which are published with a lag of a month or more. In addition, unlike published indexes, the market data on which MMRI is based is not adjusted. Accordingly, MMRI is intended for use as a supplement for developing perspective on the current month's economic profile until a complete data set is published.

If MMRI falls under 0%, that would suggest that recession risk is elevated. By contrast, readings above 0% imply that the markets are anticipating/forecasting economic growth. MMRI increased to **4.28%** as of August 21st. This reading suggests business cycle risk is low.

One month ago: 2.40%
Two months ago: -0.88%

4. **Chicago Fed National Activity Index (CFNAI).** The CFNAI for July indicates that economic activity has once more increased, although growth still remains below its historic average.

The CFNAI is a weighted average of 85 existing monthly national economic indicators. It is constructed to have an average value of zero and a standard deviation of one. Since economic activity trends toward growth over time, a positive reading corresponds to growth above trend and a negative reading corresponds to growth below trend. Research has found that the CFNAI provides a useful gauge on current and future economic activity and inflation in the U.S. The index's three month moving average provides a more consistent picture of national economic growth and is therefore used by Estate Counselors, LLC instead of the volatile monthly numbers.

When the three month moving average moves below -0.70 following a period of economic expansion, there is an increasing likelihood that a recession has begun. Conversely, when the three month moving average is above 0.70 after a period of economic contraction, there is an increasing likelihood that a recession has ended.

The three-month moving average for the month of July registered **-0.10**. However, it remains above the -0.70 level that would signal the onset of a recession.

One month ago: -0.12
Two months ago: -0.36

B. MARKET VALUATION INDICATORS

- 1. **Bullish Percent Index (BPI).** BPI indicates that stock valuations have recently entered into overvalued territory.

BPI is a popular market breadth indicator that is calculated by dividing the number of stocks in a given group (an exchange, an industry, etc.) that are currently trading with Point and Figure buy signals, by the total number of stocks in that group. For example, if 2,100 stocks signal buy and 700 signal sell, the value of the NYSE Bullish Percent Index is 75.

As of August 22nd, the BPI for the NYSE index is **71.12%**. When the percentage of bullish stocks within a particular index is 70% or higher, the index is considered to be overvalued. When the index is below 30, stocks are considered to be oversold.

One month ago: 69.57%
 Two months ago: 56.07%

- 2. **CAPE Ratio.** The CAPE ratio has increased to its high of the year and it indicates stocks are valued well above their historical average

CAPE is a modified form of the PE ratio of the S&P 500 as determined by Robert Schiller. CAPE is simply the S&P 500 index's current price divided by the 10-year average of trailing earnings, adjusted for inflation. A high CAPE reading may be evidence that stock prices are inflated. The long term average of this ratio is 16.68, while its historical high is 44.2.

| | Cape on 8/22/16 | Median | Mean | High | Above Average | Neutral | Low |
|------|-----------------|--------|-------|-------|---------------|-----------|-------|
| Cape | 27.08 | 16.04 | 16.68 | 25.1+ | 22.5-25 | 17.5-22.4 | <17.4 |
| | One month ago: | | 26.89 | | | | |
| | Two months ago: | | 24.91 | | | | |

- 3. **Total Market Cap of the U.S. Stock Market to GDP.** The Total Market Cap to GDP ratio decreased slightly from the prior month but it remains in "significantly overvalued" territory, as defined by gurufocus.com. At this level, gurufocus.com states that the stock market is currently likely to return 0% per year, including dividends.

This statistic is an indicator of whether the stock market is fairly valued. It compares how much money is invested in the market relative to GDP, which is closely tied to corporate profits. A high reading would be an indication that equity prices are inflated.

| | Market Cap to GDP on 8-22-16 | Median | Mean | High | Above Average | Neutral | Low |
|---------------------|------------------------------|--------|--------|------|---------------|-----------|------|
| Market Cap to GDP % | 122.6% | 68.83 | 75.89% | 115+ | 90.1%-115% | 50.1%-90% | <50% |

One month ago: 123.4%
Two months ago: 119.7%

4. **Tobin's Q.** Tobin's Q has been increasing in recent months and it is suggesting stocks are at above average valuations.

This statistic is calculated by dividing Total Market Value (as represented by the Wilshire 5000) by the Total Asset Value. A low Q (between 0 and 1) means the cost of the assets of companies included in the Wilshire 5000 is greater than the combined value of their stock. In that event the stock market is undervalued. Conversely, a high Q (greater than 1) implies that the stock price of all Wilshire 5000 companies exceeds the replacement cost of the assets of those companies. A Tobin's Q that significantly exceeds its historic average of 0.68 is a potential indicator of an equity market bubble.

| | Tobins Q on 8/1/16 | Median | Mean | High | Above Average | Neutral | Low |
|-----------|--------------------|--------|------|-------|---------------|-----------|-------|
| Tobin's Q | 1.04 | 0.76 | 0.68 | 0.90+ | 0.75-0.90 | 0.65-0.70 | <0.65 |

One month ago: 0.98
Two months ago: 0.97

5. **S&P Earnings Yield.** This measure indicates that stock valuations have increased while high yield bond valuations have held steady since last month.

This statistic is the inverse of the S&P 500's P/E ratio (trailing 12 month earnings divided by index price). It can be used to compare equity valuations with the yield on bonds. If the S&P earning's yield is higher than the yield on high yield bonds, then that is an indication that stocks represent a better value than their closest fixed-income equivalent.

As of August 22nd, the S&P 500 earnings yield is 3.97% while the yield on high yield bonds is 6.17%. This amounts to a spread of +2.20%. The spread has increased as stock prices have climbed faster than their earnings.

| | S&P | Bonds | Spread |
|-----------------|-------|-------|--------|
| One month ago: | 3.98% | 6.30% | +2.32% |
| Two months ago: | 4.32% | 6.30% | +1.98% |

C. Hidden Markov Model (HMM)

The HMM increased slightly during August but continues to indicate that stocks are currently in a Bear market.

A Hidden Markov Model is an econometric tool for representing probability distributions over sequences of observations. The model can be used to estimate the probability of a bull or bear market. It uses trailing S&P 500 1-year returns (calculated monthly) and the previous month's probability of a bull market as inputs and then generates the current probability of a bull or bear market as an output. HMM readings above 75% indicate a high probability of a current bull market. If the HMM reading is below 25%, it is an indicator of a high probability of a bear market. As of August 19th, the HMM output is **10.07%**.

One month ago: 9.44%
Two months ago: 9.01%

D. ECHI

The Estate Counselors, LLC Hedge Index (ECHI) was developed to provide an empirical signal for when a hedge on equities should be established due to an impending market decline. ECHI is a composite risk index that draws on the output of the Crash Risk Index (CRI) which is an equal-weighted mix of ten indicators developed by Jim Picerno of The Capital Spectator, drawing on a diverse range of U.S. equity and bond market factors. It provides a daily measure of risk for evaluating the potential for a near-term market correction/crash. **0 of the 10 SMRI signals are currently active.** If 5 or more of the SMRI indicators signals are active, ECHI signals high market risk ("Hedge On"). Once ECHI is triggered it will continue to signal Hedge On until less than 5 SMRI signals are active. ECHI is currently signaling **Hedge Off**.

END NOTES

- The latest ETI reading can be found at <http://www.capitalspectator.com/>.
- The latest EMI reading can also be found at <http://www.capitalspectator.com/>.
- The latest MMRI reading can also be found at <http://www.capitalspectator.com/>.

END NOTES CONTINUED

- A reading of the bullish percent index for the NYSE can be found at <http://stockcharts.com/h-sc/ui> using the symbol \$BPNYA.
- The most recent CAPE reading can be found at <http://ycharts.com/indicators/pe10>.
- A current reading of total market cap to GDP can be found at <http://www.gurufocus.com/stock-market-valuations.php>.
- Tobins Q can be found at <http://www.advisorperspectives.com/dshort/updates/Q-Ratio-and-Market-Valuation.php>.
- The current S&P earnings yield can be found at <http://www.multpl.com/s-p-500-earnings-yield>.
